

**CLAIMS**

What I claim as my REFORM Energy System invention:

1. The Woods Wind Collector (A, B, C, D, and E) will capture the energy that is produce by vehicular motion.
2. The capture energy will speed-up inside the ducts by reducing the duct size from the wind collectors and the wind cylinder. Also, the draft inside of the cylinder assembly acts as a suction mechanism that pulls the captured wind energy from the wind collectors, thus creating a wind tunnel.
3. The Wind Cylinder Assembly (sheet 2 of 6) is a series of pipes that is reduced from a ten foot diameter (10 ft. dia.) to a eight foot diameter (8 ft. dia.) within a ten foot distance. The winds speed is increased impact of the slave fan blades to produce a greater wind speed that will power the generator gearbox to produce electricity.
4. The Master Fan pushes and pulls the captured energy from one cylinder to another to complete the wind energy cycle inside the wind cylinder. The carbon filter will assist in cleaning the air inside the wind cylinder assembly before its escape into earth's atmosphere.
5. The Slave Fans will rotate, thus spinning the flywheel and the shaft of gearbox from the wind produced from the master fan and the wind collectors inside the wind cylinder assembly.
